For an explanation of the shortcodes labelling, please refer to our user guide[1].

0.1 General Concepts

Students should understand the meaning and importance of the following notions. This statement should be read as "understand the first sentence or paragraph on a wikipedia article", taking high-level programming language[2] as an example.

- Programming languages types and paradigms

    – Machine language instructions
    – Assembly instructions
    – High-Level Programming Languages
    – Object-oriented paradigm and data hiding

- The difference between roles (user, tester, programmer)
- How complex piece of software *reuse* previous pieces.
- The importance of security ♡

    – Types of attack (malware, phishing, social engineering, zero-day)
    – Types of loss (loss of integrity / availability / confidentiality)

0.2 Writing and Compiling Programs

- Understand what the "flow of development" is:

    – Having a goal
    – Writing down specifications
    – Creating the source code
    – Running the compiler
    – Reading the compiler's output, warning and error messages
    – Looking for documentation and help on-line and off-line
    – Testing
    – Making sure the program is secure ♡
    – Editing
    – Reusing

- Using an IDE to

    – Create a project,
    – Perform some of the steps of the "flow of development",
    – Correctly save and re-open projects,
    – Understand basic features of break points and debugging. **?**

The IDE used can be MonoDevelop[3] or Visual Studio[4], the student can pick other IDEs if they wish but they will not be supported.

[4]https://visualstudio.microsoft.com/

0.3 Computer Usage

- How to download and install an IDE in a secure way ♡
- How to share and zip a project
- How to use shortcuts **?**
- How to look for on-line documentation

0.4 The Structure of a Program

0.4.1 First Program - Hello World

The students should understand all the components of a simple "Hello World" program:

- Comments (in line and block)
- `using` statements and namespace / API concepts
- blank lines and spacing
- indentation
- intro to classes and methods' structures (body / header)
- status of `Main` method
- intro to Console's `Write` and `WriteLine`
- string literal

0.4.2 Rules and Conventions

- The difference between a "rule" (e.g. case-sensitivity) and a "convention" (commenting your code).
- Reserved words
- Identifiers and naming conventions
- That the distinction can vary with the programming language
- Importance and role of { and }

1 Datatypes and Operators

1.1 Variable

- Datatype (numerical, boolean, string, character) – including a mention of reference datatypes
- Declaration, assignment, initialization
- Naming variables correctly
- The absence of default value after declaration (un-assigned variables)

1.2 Numerical Values

- Integers (`int`, `long`) – range and size, signature (`uint`)
- Floating Point (`float`, `double`, and `decimal`) – range, size and precision,
- Type casting (e.g. from `int` to `double`, and legal operations between different datatypes) and casting operator (e.g. (`int`)).
- Overflow and underflow ♡

1.3 Booleans

- Possible values (**true**, **false**)
- Usage
- That boolean variables are called "switches"

1.4 Operators

- Binary arithmetic operators: `*`, `/`, `%`, `+`, `-`
- Unary arithmetic operators: `++`, `--`
- The difference between postfix and infix notation for unary operators **?**
- Comparison operators: `!=`, `==`, `>`, `>=`, `<`, `<=`
- Boolean logical operators: `&&`, `||`, `!`
- Precedence and "validity" of some expressions (typically, `! 2 < 3` is not a valid expression)
- Combined assignment operators: `+=`, `*=`, `-=`, `/=`, `%=`

1.5 Strings

- `ReadLine` method
- Concatenation (`+`)
- Interpolation
- Additional methods: `ToLower`, `ToUpper`, `Contains`, `StartsWith`, `EndsWith` **?**

1.5.1 Displaying Strings on the Screen

- Format specifiers[5] for numbers: – Currency (`C`),
    - Fixed-point (`F`) or Number (`N`)
    - Percent (`P`) **?**
    - Exponential (`E`) **?**
- The `String.Format` method **?**

1.6 Characters

- Possible values and the existence of binary, oct, dec and hex representation (cf. for instance wikipedia[6])
- Escape character and sequences: `\n`, `\t`, `\\`
- Conversion between glyph and decimal value.
- Various methods: `ToLower`, `ToUpper` **?**

---

[6]https://www.wikiwand.com/en/ASCII#Printable_characters

2 Lists ?

- Creating a list of numbers or strings
- Adding items using the `Add` method
- Accessing items using `[ ]`
- Removing and Inserting (`Remove`, `RemoveAt`, `Insert`)
- `Count` property

3 Basic Control Structures

3.1 Selection Statements

For each of the following structure:

- **if**
- **if**-**else**
- **if**-**else if**
- nested **if**s
- **switch**

The student should understand

- Their importance,
- Their usage,
- Their syntax,
- Their flow,
- When to use one or the other,
- The common pitfalls (e.g., writing a condition in a **switch**).

3.2 Repetition Statements

For each of the following structure:

- **foreach**
- **while**
- **for**
- **do**{…}**while**(…) ?

The student should understand:

- Their importance,
- Their usage,
- Their syntax,
- Their flow,
- When to use one or the other,
- The common pitfalls (e.g. = instead of ==, <= n vs < n)

As well as being capable of identifying the difference between

- Counter-controlled,
- Sentinel-controlled,
- User-controlled

and defining the term "accumulator"

4 Object-oriented programming

4.1 Class Conception

- Need and interest of specification ♡
- UML Class diagram: interest, usage, and simple case (single class with attributes, methods and constructor).
- Access modifier (private, public)
- Principle of least privilege (private variables and methods where possible) ♡

4.2 Class Implementation

- Attributes (and their default value, as well as how to change them)
- Get and Set methods
- Properties **?**
- Method signature
- Overloading
- Variable shadowing[7] **?**
- Constructors: default constructor and "custom" constructor

4.3 Class Usage

- The **new** keyword
- Object creation using default and custom constructors
- Object manipulation: calling a method, setting an attribute, calling the `ToString` method implicitly.

4.4 Additional Considerations

- `ToString` method
- static class and methods
- `Math` Class[8] (`Abs`, `Sqrt`, `Pow`) **?**

5 Random Class

- Creating a generator with **new** `Random()`
- Generating non-negative integers,
- Generating integers between ranges,
- Generating double,
- Generating a random word **?**
- Potential problems with deterministic generators ♡

---

[7]https://www.wikiwand.com/en/Variable_shadowing
[8]https://learn.microsoft.com/en-us/dotnet/api/system.math

6 Testing and Debugging

- How to test intelligently
- How to test every instruction
- How to test boundary conditions

7 Interacting with Users

- Input validation ♡
- `TryParse` in the `int` and `decimal` classes.
- Reading a single character from the user **?**

8 Data structures

8.1 Constant

- The `const` keyword
- Example usages (Avogadro constant, miles-to-kilometer ratio, speed of light) and use case.
- `Math.PI` **?**
- Static constant **?**

8.2 Enumerated Datatype **?**

- Define enumerated datatypes using **enum**
- Enum values (i.e. numerical values assigned to enumerated values by default) **?**
- Use enumerated datatypes (variable declaration, assignment, displaying).

8.3 Arrays

Only one-dimensional arrays should be discussed.

- Vocabulary: index (starting at 0), bounds.
- `Length` property
- `Resize` method **?**
- Different syntaxes for initializing and declaring arrays **?**
- Buffer overflow ♡

9 Exceptions ⇒SOON

- `try...catch` blocks
- Types of exceptions
- **finally**
- Defining your own exception

10 File I/O ➡ SOON

- StreamWriter and StreamReader classes
- Manipulating binary and text files
- File class **?**
